The value of mother’s milk in the NICU

Mother’s milk is not only nutrition, it is a medical intervention. Providing this milk is the most helpful thing mothers can do for their infant in the NICU. Empowering parents with evidence-based information about human milk can help families to give their preterm or sick infant the best possible start. 1, 2

Protective components

Powerful colostrum

Colostrum is packed with factors that promote intestinal development and reduce the infant’s infection risk. The earlier the infant is born, the higher the concentration of these components. 2, 3

Living cells

Fresh milk contains thousands to millions of live cells per millilitre. Among these are leukocytes that protect the infant from infection, and stem cells that may act as an internal building and repair system. 6

Antibody boost

While touching or holding her infant, a mother starts to make specific antibodies against germs in her infant’s surroundings. Infants then receive these protective antibodies through their mother’s milk. 4, 5

Fats for brain development

Many different fats in mother’s milk, like omega-3 fatty acids, optimise brain growth and development in the preterm infant who missed crucial growth occurring in the last trimester. 7, 8

Lifelong benefits

Fewer long-term morbidities

Compared with formula feeding, human milk reduces the risk of necrotising enterocolitis (NEC), sepsis, SIDS and many other diseases in the first year of life. 11 – 15

Better quality of life

Since human milk decreases morbidity and mortality compared to formula feeding, it reduces health care costs, increases the productivity of society and improves quality of life. 14

A mother’s milk is specifically designed for her infant. Mothers should be encouraged to express colostrum and breast milk for as long as possible, since this is something that only they can do for their child. Supporting mothers to pump early and frequently will help them to provide their infant with the lifelong benefits of an exclusive human milk diet. 16
